

Future-Proof Your SuDS Project

Meeting new SuDS standards with Silva Cell and Marino Cell

DeepRoot's green infrastructure solutions have always been rooted in the same principles now formalised by the UK's SuDS standards — because these goals aren't just regulatory boxes to check, they're central to our mission. Our systems deliver integrated, nature-based stormwater management with added benefits like healthy tree growth, space-saving efficiency, and long-term performance.

SuDS-Ready Solutions

Manage Runoff Where it Falls

Natural, on-site water management. Silva Cell and Marino Cell treat water beneath the surface, mimicking natural hydrology.

Reduced Flood Risk

Filtering and storing stormwater at source reduce peak flow during heavy rain events, easing pressure on downstream infrastructure.

Improved Water Quality

Runoff in Silva Cells is filtered through biologically active soil, removing sediments, metals, and other urban pollutants.

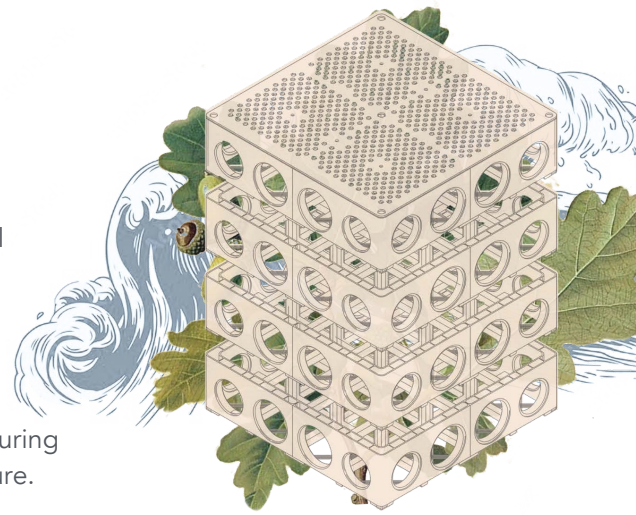

Amenity & Biodiversity

Stormwater in our systems is treated as an asset and not a liability, used for natural irrigation and groundwater recharge.

Maintenance & Performance

Our GI systems are data-backed solutions for stormwater management, with very little ongoing maintenance or repair requirements.
